Preface

This document contains listings of the programs I use to teach an introductory course on programming in Python. Most of the programs are from the excellent textbook *Introduction to Programming in Python: An Interdisciplinary Approach* by Robert Sedgewick, Kevin Wayne, and Robert Dondero. The programs have been modified for clarity and consistency. The listing for each program includes colorized Python code for the program with line numbers, and a terminal session showing the command to run the program along with the program output.

The programs are available as a PyCharm project ([https://www.swamiiyer.net/teaching/ipp.zip](https://www.swamiiyer.net/teaching/ipp.zip)). Consult the section *Programming Environment Setup* for instructions on how to setup your personal computer with the environment needed to run the programs. To open the project, launch PyCharm and open `~/workspace/ipp/programs`. You can run a program on the PyCharm terminal, as follows:

```
~/workspace/ipp/programs
$ python3 helloworld.py
Hello, World
$ _
```

You can also run/debug a program within PyCharm by selecting an appropriate *Run/Debug configuration* and clicking *Run* or *Debug*.

Input data files are available under the `data` folder, also included in `ipp.zip`. The table in section *Data Files* lists the names of the data-driven programs, references to them within this document, and the relevant data files.
Programming Environment Setup

On Ubuntu Linux

1. Download and install PyCharm (Community Edition). Launch PyCharm, go to Configure → Settings and set Project Interpreter to /usr/bin/python3.

2. Install dependencies:

   ```
   $ sudo apt-get install python3-pip python3-tk
   $ sudo pip3 install numpy pygame
   ```

3. Create and update $HOME/lib folder:

   ```
   $ mkdir lib
   $ cd lib
   $ wget https://www.svamiiyer.net/teaching/stdlib-python.zip
   $ unzip stdlib-python.zip
   $ rm stdlib-python.zip
   ```

4. Set the PYTHONPATH environment variable:

   ```
   $ echo "export PYTHONPATH=./$:HOME/lib/stdlib-python" >> $HOME/.bashrc
   ```

5. Obtain the programs:

   ```
   $ mkdir workspace
   $ cd workspace
   $ wget https://www.svamiiyer.net/teaching/ipp.zip
   $ unzip ipp.zip
   $ rm ipp.zip
   ```

On Mac OS X

1. Download and install Python 3.

2. Download and install PyCharm (Community Edition). Launch PyCharm, go to Configure → Settings and set Project Interpreter to Python 3 downloaded in the previous step.

3. Install dependencies:

   ```
   $ pip3 install numpy pygame
   ```

4. Create and update $HOME/lib folder:

   ```
   $ mkdir lib
   $ cd lib
   $ wget https://www.svamiiyer.net/teaching/stdlib-python.zip
   $ unzip stdlib-python.zip
   $ rm stdlib-python.zip
   ```

5. Set the PYTHONPATH environment variable:

   ```
   $ echo "export PYTHONPATH=./$:HOME/lib/stdlib-python" >> $HOME/.bash_profile
   ```

6. Obtain the programs:
On Windows

1. Install Python 3 from Microsoft Store.

3. Install dependencies:

```
$ pip3 install numpy pygame
```

4. Create a `lib` folder under `%USERPROFILE%`, download and unzip the file `https://www.swamiiyer.net/teaching/stdlib-python.zip` into that folder, and remove the zip file.

5. Set `PYTHONPATH` environment variable to `.;%USERPROFILE%/lib/stdlib-python`.

6. Create a `workspace` folder under `%USERPROFILE%`, download and unzip the file `https://www.swamiiyer.net/teaching/ipp.zip` into that folder, and remove the zip file.

---

$ mkdir workspace
$ cd workspace
$ wget https://www.swamiiyer.net/teaching/ipp.zip
$ unzip ipp.zip
$ rm ipp.zip

---

1 The `USERPROFILE` environment variable is set to the user’s home folder.

1 Imperative Programming

1.1 Your First Programs

1.1.1 helloworld.py

```python
# Writes the message 'Hello, World' to standard output.
import stdio
stdio.writeln('Hello, World')
```

```
~/workspace/ipp/programs
$ python3 helloworld.py
Hello, World
```

1.1.2 useargument.py

```python
# Accepts a name as command-line argument; and writes a message containing that name to standard output.
import stdio
import sys
stdio.write('Hi, ') stdio.write(sys.argv[1]) stdio.writeln(' . How are you?')
```

```
~/workspace/ipp/programs
$ python3 useargument.py Alice
Hi, Alice . How are you?
$ python3 useargument.py Bob
Hi, Bob . How are you?
$ python3 useargument.py Carol
Hi, Carol . How are you?
```

1.2 Basic Data Types

1.2.1 dateformats.py

```python
# Accepts d (str), m (str), and y (str) representing a date as command-line arguments; and writes the date in different formats to standard output.
import stdio
import sys
d = sys.argv[1]
m = sys.argv[2]
y = sys.argv[3]
dmy = d + '/' + m + '/' + y
mdy = m + '/' + d + '/' + y
ymd = y + '/' + m + '/' + d
stdio.writeln(dmy)
stdio.writeln(mdy)
stdio.writeln(ymd)
```

```
~/workspace/ipp/programs
$ python3 dateformats.py 14 03 1879
14/03/1879
03/14/1879
1879/03/14
```

1.2.2  sumofsquares.py

```python
# Accepts x (int) and y (int) as command-line arguments; and writes the sum of their squares to standard output.

import stdio
import sys

x = int(sys.argv[1])
y = int(sys.argv[2])
sumOfSquares = x * x + y * y
stdio.writeln(sumOfSquares)
```

```bash
$ python3 sumofsquares.py 3 4
25
$ python3 sumofsquares.py 6 8
100
```

1.2.3  quadratic.py

```python
# Accepts a (float), b (float), and c (float) as command-line arguments; and writes the two roots of the quadratic equation ax^2 + bx + c = 0 to standard output.

import math
import stdio
import sys

a = float(sys.argv[1])
b = float(sys.argv[2])
c = float(sys.argv[3])
discriminant = b * b - 4 * a * c
root1 = (-b + math.sqrt(discriminant)) / (2 * a)
root2 = (-b - math.sqrt(discriminant)) / (2 * a)
stdio.writeln('Root # 1 = ' + str(root1))
stdio.writeln('Root # 2 = ' + str(root2))
```

```bash
$ python3 quadratic.py 1 -5 6
Root # 1 = 3.0
Root # 2 = 2.0
$ python3 quadratic.py 1 -1 -1
Root # 1 = 1.618033988749895
Root # 2 = -0.6180339887498949
```

1.2.4  leapyear.py

```python
# Accepts a year (int) as command-line argument; and writes to standard output whether the year is a leap year or not.

import stdio
import sys

year = int(sys.argv[1])
isLeapYear = year % 4 == 0
isLeapYear = isLeapYear and year % 100 != 0
isLeapYear = isLeapYear or year % 400 == 0
stdio.writeln(isLeapYear)
```

```bash
$ python3 leapyear.py 2020
True
$ python3 leapyear.py 1900
False
```
1.3 Control Flow

1.3.1 grade.py

```python
# grade.py
import stdio
import sys

score = float(sys.argv[1])
if score >= 93:
    stdio.writeln('A')
elif score >= 90:
    stdio.writeln('A-')
elif score >= 87:
    stdio.writeln('B+')
elif score >= 83:
    stdio.writeln('B')
elif score >= 80:
    stdio.writeln('B-')
elif score >= 77:
    stdio.writeln('C+')
elif score >= 73:
    stdio.writeln('C')
elif score >= 70:
    stdio.writeln('C-')
elif score >= 67:
    stdio.writeln('D+')
elif score >= 63:
    stdio.writeln('D')
elif score >= 60:
    stdio.writeln('D-')
else:
    stdio.writeln('F')
```

```
$ python3 grade.py 97
A
$ python3 grade.py 56
F
```

1.3.2 flip.py

```python
# flip.py
import stdio
import stdrandom

result = 'Heads' if stdrandom.bernoulli(0.5) else 'Tails'
stdio.writeln(result)
```

```
$ python3 flip.py
Heads
$ python3 flip.py
Heads
$ python3 flip.py
Tails
```

1.3.3 nhellos.py

```python
# Accepts n (int) as command-line argument; and writes n Hellos to standard output.
import stdio
import sys
n = int(sys.argv[1])
i = 1
while i <= n:
    stdio.writeln('Hello # ' + str(i))
i += 1
```

```
~/workspace/ipp/programs
$ python3 nhellos.py 10
Hello # 1
Hello # 2
Hello # 3
Hello # 4
Hello # 5
Hello # 6
Hello # 7
Hello # 8
Hello # 9
Hello # 10
$_
```

1.3.4 powersoftwo.py

```python
# Accepts n (int) as command-line argument; and writes to standard output a table of powers of 2
# that are less than or equal to 2^n.
import stdio
import sys
n = int(sys.argv[1])
power = 1
for i in range(n + 1):
    stdio.writeln(str(i) + ' ' + str(power))
power *= 2
```

```
~/workspace/ipp/programs
$ python3 powersoftwo.py 8
0 1
1 2
2 4
3 8
4 16
5 32
6 64
7 128
8 256
$_
```

1.3.5 divisorpattern.py

```python
# Accepts n (int) as command-line argument; and writes to standard output a table where entry
# (i, j) is an "*" if j divides i or i divides j and a " " otherwise.
import stdio
import sys
n = int(sys.argv[1])
for i in range(1, n + 1):
    for j in range(1, n + 1):
        if i % j == 0 or j % i == 0:
            stdio.write('* ')```
1.3.6  harmonic.py

```python
# Accepts n (int) as command-line argument; and writes the nth harmonic number (1 + 1/2 + ... + 1/n) to standard output.

import stdio
import sys

n = int(sys.argv[1])
total = 0.0
for i in range(1, n + 1):
    total += 1 / i
stdio.writeln(total)
```

$ python3 harmonic.py 10
2.9289682539682538
$ python3 harmonic.py 1000
7.485470860550343
$ python3 harmonic.py 10000
9.787660360444348

1.3.7  sqrt.py

```python
# Accepts c (float) as command-line argument; and writes the square root of c to standard output.
# Computed using Newton's method.

import stdio
import sys

c = float(sys.argv[1])
EPSILON = 1e-15
t = c
while abs(t - c / t) > EPSILON * t:
    t = (c / t + t) / 2
stdio.writeln(t)
```
### 1.3.8 binary.py

```python
# Accepts n (int) as command-line argument; and writes the binary representation of n to standard output.
import stdio
import sys

n = int(sys.argv[1])
v = 1
while v <= n // 2:
    v *= 2
while v > 0:
    if n < v:
        stdio.write('0')
    else:
        stdio.write('1')
    n -= v
    v //= 2
stdio.writeln()
```

### 1.3.9 gambler.py

```python
# Accepts stake (int), goal (int), and trials (int) as command-line arguments; runs trials experiments (dollar bets) that start with stake dollars and terminate on 0 dollars or goal; and writes the percentage of wins and the average number of bets per experiment to standard output.
import stdio
import sys
import stdrandom

stake = int(sys.argv[1])
goal = int(sys.argv[2])
trials = int(sys.argv[3])
bets = 0
wins = 0
for t in range(trials):
    cash = stake
    while cash > 0 and cash < goal:
        bets += 1
        if stdrandom.bernoulli():
            cash += 1
        else:
            cash -= 1
    wins += cash == 0
stdio.writeln('Percentage of wins: ' + str(float(wins) / trials) + '
Average number of bets: ' + str(float(bets) / trials))
```
Introduction to Programming in Python

if cash == goal:
    wins += 1
stdio.writeln(str(100 * wins // trials) + '% wins')
stdio.writeln('Avg # bets: ' + str(bets // trials))

1.3.10 factors.py

# Accepts n (int) as command-line argument; and writes the prime factors of n to standard output.

import stdio
import sys

n = int(sys.argv[1])
factor = 2
while factor * factor <= n:
    while n % factor == 0:
        stdio.write(str(factor) + ' ')
        n //= factor
    if n > 1:
        stdio.write(n)
stdio.writeln()

1.4 Collection Data Types

1.4.1 sample.py

# Accepts m (int) and n (int) as command-line arguments; and writes to standard output a random
# sample of m integers in the range [0, n), with no duplicates.

import stdarray
import stdio
import stdrandom
import sys

m = int(sys.argv[1])
n = int(sys.argv[2])
perm = stdarray.create1D(n, 0)
for i in range(n):
    perm[i] = i
for i in range(m):
    r = stdrandom.uniformInt(i, n)
    temp = perm[r]
    perm[r] = perm[i]
    perm[i] = temp
for i in range(m):
    stdio.write(str(perm[i]) + ' ')
# Introduction to Programming in Python

## 1.4.2  couponcollector.py

```python
# Accepts n (int) as a command-line argument; and writes to standard output the number of coupons
# you collect before obtaining one of each of n types.
import stdarray
import stdio
import stdrandom
import sys

n = int(sys.argv[1])
count = 0
collectedCount = 0
isCollected = stdarray.create1D(n, False)

while collectedCount < n:
    value = stdrandom.uniformInt(0, n)
count += 1
    if not isCollected[value]:
collectedCount += 1
    isCollected[value] = True
stdio.writeln(count)
```

## Terminal output:

```
$ python3 couponcollector.py 1000
6276
$ python3 couponcollector.py 1000
7038
$ python3 couponcollector.py 1000000
13401736
$ python3 couponcollector.py 100000000
5761455
```

## 1.4.3  primesieve.py

```python
# Accepts n (int) as command-line argument; and writes the number of primes <= n to standard output.
import stdarray
import stdio
import sys

n = int(sys.argv[1])
isPrime = stdarray.create1D(n + 1, True)

for i in range(2, n):
    if isPrime[i]:
        for j in range(2, n // i + 1):
            isPrime[i * j] = False

count = 0
for i in range(2, n + 1):
    if isPrime[i]:
count += 1
stdio.writeln(count)
```

## Terminal output:

```
$ python3 primesieve.py 100
25
$ python3 primesieve.py 1000
168
$ python3 primesieve.py 100000
78498
$ python3 primesieve.py 100000000
5761455
```
1.4.4 selfavoid.py

```
# selfavoid.py
#
# Accepts n (int) and trials (int) as command-line arguments; and writes to standard output the
# percentage of dead ends encountered out of trials self-avoiding random walks on an n-by-n lattice.
#
import stdarray
import stdio
import stdrandom
import sys

n = int(sys.argv[1])
trials = int(sys.argv[2])
deadEnds = 0

for t in range(trials):
    a = stdarray.create2D(n, n, False)
    x = n // 2
    y = n // 2

    while x > 0 and x < n - 1 and y > 0 and y < n - 1:
        a[x][y] = True
        if a[x-1][y] and a[x+1][y] and a[x][y-1] and a[x][y+1]:
            deadEnds += 1
            break

    r = stdrandom.uniformInt(1, 5)
    if r == 1 and not a[x+1][y]:
        x += 1
    elif r == 2 and not a[x-1][y]:
        x -= 1
