## Preface  
4

## Programming Environment Setup  
5

## Data Files  
7

### 1 Imperative Programming  
8

#### 1.1 Your First Programs  
8

- 1.1.1 helloworld.py  
8
- 1.1.2 useargument.py  
8

#### 1.2 Basic Data Types  
8

- 1.2.1 dateformats.py  
8
- 1.2.2 sumofsquares.py  
9
- 1.2.3 quadratic.py  
9

#### 1.3 Control Flow  
10

- 1.3.1 grade.py  
10
- 1.3.2 flip.py  
10
- 1.3.3 nhellos.py  
11
- 1.3.4 powersoftwo.py  
11
- 1.3.5 divisorpattern.py  
11
- 1.3.6 harmonic.py  
12
- 1.3.7 sqrt.py  
12
- 1.3.8 binary.py  
13
- 1.3.9 gambler.py  
13
- 1.3.10 factors.py  
14

#### 1.4 Collection Data Types  
14

- 1.4.1 sample.py  
14
- 1.4.2 couponcollector.py  
15
- 1.4.3 primesieve.py  
15
- 1.4.4 selfavoid.py  
16

#### 1.5 Input and Output  
16

- 1.5.1 randomseq.py  
16
- 1.5.2 twentyquestions.py  
17
- 1.5.3 average.py  
18
- 1.5.4 rangefilter.py  
18
- 1.5.5 plotfilter.py  
18
- 1.5.6 bouncingball.py  
19
- 1.5.7 playthattune.py  
20

#### 1.6 Case Study: What Makes Google Different? (PageRank Algorithm)  
20

- 1.6.1 transition.py  
20
- 1.6.2 randomsurfer.py  
21
- 1.6.3 markov.py  
21

### 2 Procedural Programming  
22

#### 2.1 Defining Functions  
22

- 2.1.1 harmonicredux.py  
22
- 2.1.2 couponcollectorredux.py  
22
- 2.1.3 playthattunedeluxe.py  
23

#### 2.2 Modules and Applications  
24

- 2.2.1 gaussiantable.py  
24
- 2.2.2 gaussian.py  
24
- 2.2.3 ifs.py  
25
## 3 Object-oriented Programming

### 3.1 Using Data Types
- `potentialgene.py` .................................................. 35
- `alberssquares.py` .................................................. 36
- `luminance.py` ....................................................... 36
- `grayscale.py` ....................................................... 37
- `fade.py` ............................................................. 38
- `cat.py` .............................................................. 39
- `split.py` ............................................................ 39

### 3.2 Creating Data Types
- `timeops.py` .......................................................... 40
- `stopwatch.py` ....................................................... 41
- `bernoulli.py` ....................................................... 41
- `histogram.py` ....................................................... 42
- `drunks.py` .......................................................... 43
- `turtle.py` ........................................................... 44

### 3.3 Designing Data Types
- `complex.py` ........................................................ 45
- `mandelbrot.py` ...................................................... 46
- `vector.py` .......................................................... 47
- `sketch.py` .......................................................... 48
- `comparedocuments.py` ............................................. 49
- `counter.py` ........................................................ 50
- `country.py` ......................................................... 51
- `fibonaccisequence.py` ............................................ 52
- `words.py` ........................................................... 53
- `errorhandling.py` ................................................ 53

### 3.4 Case Study: The Music of the Spheres (N-body Problem)
- `body.py` ............................................................. 54
- `universe.py` ......................................................... 55
- `nbody.py` ............................................................ 56

## 4 Data Structures and Algorithms

### 4.1 Performance
- `threesum.py` ....................................................... 57

### 4.2 Searching and Sorting
- `linearsearch.py` ................................................... 58
- `binarysearch.py` ................................................... 58
- `zipf.py` ............................................................. 59
- `insertion.py` ....................................................... 60

Preface

This document contains listings of the programs I use to teach an introductory course on programming in Python. Most of the programs are from the excellent textbook *Introduction to Programming in Python: An Interdisciplinary Approach* by Robert Sedgewick, Kevin Wayne, and Robert Dondero. The programs have been modified for clarity and consistency. The listing for each program includes colorized Python code for the program with line numbers, and a terminal session showing the command to run the program along with the program output.

The programs are available as a PyCharm project (https://www.swamiiyer.net/teaching/ipp.zip). Consult the section *Programming Environment Setup* for instructions on how to setup your personal computer with the environment needed to run the programs. To open the project, launch PyCharm and open `~/workspace/ipp/programs`. You can run a program on the PyCharm terminal, as follows:

```
~/workspace/ipp/programs
$ python3 helloworld.py
Hello, World
$ 
```

You can also run/debug a program within PyCharm by selecting an appropriate *Run/Debug configuration* and clicking *Run* or *Debug*.

Input data files are available under the *data* folder, also included in ipp.zip. The table in section *Data Files* lists the names of the data-driven programs, references to them within this document, and the relevant data files.
Programming Environment Setup

In the following sections, lines starting with the $ symbol denote commands to be run in the terminal, and the lines starting with the # symbol denote comments. When you run the suggested commands, do not copy-paste the commands into the terminal; type them out instead.

On Ubuntu Linux

1. Launch a terminal and run the following commands.

```
$ # Change to your home folder.
$ cd $HOME
$ # Install python3-pip and python3-tk.
$ sudo apt-get install python3-pip python3-tk
$ # Install numpy and pygame.
$ sudo pip3 install numpy pygame
$ # Create lib and workspace folders.
$ mkdir lib workspace
$ # Download stdlib-python.zip.
$ wget https://www.swamiiyer.net/teaching/stdlib-python.zip
$ # Unzip stdlib-python.zip under ./lib.
$ unzip stdlib-python.zip -d lib
$ # Remove stdlib-python.zip.
$ rm stdlib-python.zip
$ # Set the PYTHONPATH environment variable.
$ echo "export PYTHONPATH=$HOME/lib/stdlib-python" >> $HOME/.bashrc
$ # Download ipp.zip.
$ wget https://www.swamiiyer.net/teaching/ipp.zip
$ # Unzip ipp.zip under ./workspace.
$ unzip ipp.zip -d workspace
$ # Remove ipp.zip.
$ rm ipp.zip
```

2. Download and install PyCharm (Community Edition).

On Mac OS X

1. Launch a terminal and run the following commands.

```
$ # Change to your home folder.
$ cd $HOME
$ # Install brew.
$ /usr/bin/ruby -e "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/master/install)"
$ # Install python.
$ brew install python3
$ # Install numpy, pygame, and tk.
$ sudo pip3 install numpy pygame tk
$ # Create lib and workspace folders.
$ mkdir lib workspace
$ # Download stdlib-python.zip.
$ wget https://www.swamiiyer.net/teaching/stdlib-python.zip
$ # Unzip stdlib-python.zip under ./lib.
$ unzip stdlib-python.zip -d lib
$ # Remove stdlib-python.zip.
$ rm stdlib-python.zip
$ # Set the PYTHONPATH environment variable.
$ echo "export PYTHONPATH=$HOME/lib/stdlib-python" >> $HOME/.bash_profile
$ # Download ipp.zip.
$ wget https://www.swamiiyer.net/teaching/ipp.zip
$ # Unzip ipp.zip under ./workspace.
$ unzip ipp.zip -d workspace
$ # Remove ipp.zip.
$ rm ipp.zip
$ # Change your shell to bash.
$ chsh -s /bin/bash
```
2. Download and install PyCharm (Community Edition) ♦️. Launch PyCharm, go to Configure → Settings → Tools → Terminal and set Shell path to /bin/bash.

On Windows

1. Install Python 3 ♦️. Make sure you have checked the box that says “Add Python 3.x to PATH”.

2. Launch a powershell terminal and run the following commands.

```bash
>～/
# Change to your home folder.
$ cd $HOME
# Install numpy and pygame.
$ pip3 install numpy pygame
# Create lib and workspace folders.
$ mkdir lib, workspace
# Download stdlib-python.zip https://www.swamiyer.net/teaching/stdlib-python.zip
# Unzip stdlib-python.zip under ~/lib.
$ Expand-Archive -LiteralPath stdlib-python.zip -DestinationPath lib
# Set the PYTHONPATH environment variable.
$ setx PYTHONPATH ".; $HOME\lib\stdlib-python"
# Download ipp.zip.
$ wget -O ipp.zip https://www.swamiyer.net/teaching/ipp.zip
# Unzip ipp.zip under ~/workspace.
$ Expand-Archive -LiteralPath ipp.zip -DestinationPath workspace
# Remove ipp.zip.
$ rm ipp.zip.
```

3. Download and install PyCharm (Community Edition) ♦️. Launch PyCharm, go to Configure → Settings → Tools → Terminal and set Shell path to powershell.

1 Imperative Programming

1.1 Your First Programs

1.1.1 helloworld.py

```python
# Writes the message 'Hello, World' to standard output.
import stdio
stdio.writeln('Hello, World')
```

```
~/workspace/ipp/programs
$ python3 helloworld.py
Hello, World
```

1.1.2 useargument.py

```python
# Accepts a name as command-line argument; and writes a message containing that name to standard output.
import stdio
import sys
stdio.write('Hi, ')
stdio.write(sys.argv[1])
stdio.writeln('. How are you?')
```

```
~/workspace/ipp/programs
$ python3 useargument.py Alice
Hi, Alice. How are you?
$ python3 useargument.py Bob
Hi, Bob. How are you?
$ python3 useargument.py Carol
Hi, Carol. How are you?
```

1.2 Basic Data Types

1.2.1 dateformats.py

```python
# Accepts d (str), m (str), and y (str) representing a date as command-line arguments; and writes the date in different formats to standard output.
import stdio
import sys
d = sys.argv[1]
m = sys.argv[2]
y = sys.argv[3]
dmy = d + '/' + m + '/' + y
mdy = m + '/' + d + '/' + y
ymd = y + '/' + m + '/' + d
stdio.writeln(dmy)
stdio.writeln(mdy)
stdio.writeln(ymd)
```

```
~/workspace/ipp/programs
$ python3 dateformats.py 14 03 1879
14/03/1879
03/14/1879
1879/03/14
```

```
```
1.2.2 sumofsquares.py

```python
# sumofsquares.py
import stdio
import sys

x = int(sys.argv[1])
y = int(sys.argv[2])
result = x * x + y * y
stdio.writeln(result)
```

```bash
~/workspace/ipp/programs
$ python3 sumofsquares.py 3 4
25
$ python3 sumofsquares.py 6 8
100
$ 
```

1.2.3 quadratic.py

```python
# quadratic.py
import math
import stdio
import sys

a = float(sys.argv[1])
b = float(sys.argv[2])
c = float(sys.argv[3])
discriminant = b * b - 4 * a * c
root1 = (-b + math.sqrt(discriminant)) / (2 * a)
root2 = (-b - math.sqrt(discriminant)) / (2 * a)
stdio.writeln('Root # 1 = ' + str(root1))
stdio.writeln('Root # 2 = ' + str(root2))
```

```bash
~/workspace/ipp/programs
$ python3 quadratic.py 1 -5 6
Root # 1 = 3.0
Root # 2 = 2.0
$ python3 quadratic.py 1 -1 -1
Root # 1 = 1.618033988749895
Root # 2 = -0.6180339887498949
$ 
```

1.2.4 leapyear.py

```python
# leapyear.py
import stdio
import sys

y = int(sys.argv[1])
result = y % 4 == 0 and y % 100 != 0 or y % 400 == 0
stdio.writeln(result)
```

```bash
~/workspace/ipp/programs
$ python3 leapyear.py 2020
True
$ python3 leapyear.py 1900
False
$ python3 leapyear.py 2000
True
```
# Introduction to Programming in Python

## 1.3 Control Flow

### 1.3.1 grade.py

```python
# Accepts a percentage score (float) as command-line argument; and writes the corresponding letter grade to standard output.

import stdio
import sys

score = float(sys.argv[1])
if score >= 93:
    stdio.writeln('A')
elif score >= 90:
    stdio.writeln('A-')
elif score >= 87:
    stdio.writeln('B+')
elif score >= 83:
    stdio.writeln('B')
elif score >= 80:
    stdio.writeln('B-')
elif score >= 77:
    stdio.writeln('C+')
elif score >= 73:
    stdio.writeln('C')
elif score >= 70:
    stdio.writeln('C-')
elif score >= 67:
    stdio.writeln('D+')
elif score >= 63:
    stdio.writeln('D')
elif score >= 60:
    stdio.writeln('D-')
else:
    stdio.writeln('F')
```

```
~/workspace/ipp/programs
$ python3 grade.py 97
A
$ python3 grade.py 56
F
$ _
```

### 1.3.2 flip.py

```python
# Simulates a coin flip by writing 'Heads' or 'Tails' to standard output.

import stdio
import stdrandom

result = 'Heads' if stdrandom.bernoulli() else 'Tails'
stdio.writeln(result)
```

```
~/workspace/ipp/programs
$ python3 flip.py
Heads
$ python3 flip.py
Heads
$ python3 flip.py
Tails
$ _
```
1.3.3  nhellos.py

```python
# Accepts n (int) as command-line argument; and writes n Hellos to standard output.

import stdio
import sys

n = int(sys.argv[1])
i = 1
while i <= n:
    stdio.writeln('Hello # ' + str(i))
i += 1
```

```
~/workspace/ipp/programs
$ python3 nhellos.py 10
Hello # 1
Hello # 2
Hello # 3
Hello # 4
Hello # 5
Hello # 6
Hello # 7
Hello # 8
Hello # 9
Hello # 10
$ 
```

1.3.4  powersoftwo.py

```python
# Accepts n (int) as command-line argument; and writes to standard output a table of powers of 2
# that are less than or equal to 2^n.

import stdio
import sys

n = int(sys.argv[1])
power = 1
for i in range(n + 1):
    stdio.writeln(str(i) + ' ' + str(power))
    power *= 2
```

```
~/workspace/ipp/programs
$ python3 powersoftwo.py 8
0 1
1 2
2 4
3 8
4 16
5 32
6 64
7 128
8 256
$ 
```

1.3.5  divisorpattern.py

```python
# Accepts n (int) as command-line argument; and writes to standard output a table where entry
# (i, j) is a '*' if j divides i or i divides j and a ' ' otherwise.

import stdio
import sys

n = int(sys.argv[1])
for i in range(1, n + 1):
    for j in range(1, n + 1):
        if i % j == 0 or j % i == 0:
            stdio.write('* ')
```

```
```
```
```
```
12 else:
13     stdio.write(' ')
14     stdio.writeln(i)
```

```bash
~/workspace/ipp/programs
$ python3 divisorpattern.py 20
* * * * * * * * * * * * * * * * * * * * 1
* * * * * * * * * * * 2
* * * * * * * 3
* * * * * * * 4
* * * * * 5
* * * * * * 6
* * * 7
* * * * * 8
* * * * 9
* * * * * 10
* * 11
* * * * * * 12
* * 13
* * * * 14
* * * * 15
* * * * * 16
* * 17
* * * * * * 18
* * 19
* * * * * * 20
$ _
```

### 1.3.6 harmonic.py

```python
# harmonic.py
1 # Accepts n (int) as command-line argument; and writes the nth harmonic number (1 + 1/2 + ... + 1/n) to standard output.
2
3 import stdio
4 import sys
5
6 n = int(sys.argv[1])
7 total = 0.0
8 for i in range(1, n + 1):
9     total += 1 / i
10     stdio.writeln(total)
```

```bash
~/workspace/ipp/programs
$ python3 harmonic.py 10
2.9289682539682538
$ python3 harmonic.py 1000
7.485470860550343
$ python3 harmonic.py 10000
9.787606036044348
$ _
```

### 1.3.7 sqrt.py

```python
# sqrt.py
1 # Accepts c (float) as command-line argument; and writes the square root of c to standard output, computed using Newton’s method.
2
3 import stdio
4 import sys
5
6 c = float(sys.argv[1])
7 EPSILON = 1e-15
8 t = c
9 while abs(1 - c / (t * t)) > EPSILON:
10     t = (c / t + t) / 2
11     stdio.writeln(t)
```

---

12 / 70
1.3.8  binary.py

```python
# Accepts n (int) as command-line argument; and writes the binary representation of n to standard output.

import stdio
import sys

n = int(sys.argv[1])
v = 1
while v <= n // 2:
    v *= 2
while v > 0:
    if n < v:
        stdio.write('0')
    else:
        stdio.write('1')
    n -= v
    v //= 2
stdio.writeln()
```

1.3.9  gambler.py

```python
# Accepts stake (int), goal (int), and trials (int) as command-line arguments; runs trials experiments (dollar bets) that start with stake dollars and terminate on 0 dollars or goal; and writes the percentage of wins and the average number of bets per experiment to standard output.

import stdio
import sys
import stdrandom

stake = int(sys.argv[1])
goal = int(sys.argv[2])
trials = int(sys.argv[3])
bets = 0
wins = 0
for t in range(trials):
    cash = stake
    while 0 < cash < goal:
        bets += 1
        if stdrandom.bernoulli():
            cash += 1
        else:
            cash -= 1
    wins += cash
stdio.writeln(bets / trials)
if cash == goal:
    wins += 1
stdio.writeln(str(100 * wins // trials) + ' % wins')
stdio.writeln('Avg # bets: ' + str(bets // trials))

1.3.10 factors.py

# Accepts n (int) as command-line argument; and writes the prime factors of n to standard output.
import stdio
import sys
n = int(sys.argv[1])
factor = 2
while factor * factor <= n:
    while n % factor == 0:
        stdio.write(str(factor) + ' ')
        n //= factor
    if n > 1:
        stdio.write(n)
stdio.writeln()

1.4 Collection Data Types
